

Sure Indicator of Energy Potential

The Nutrition Guy Featuring John Heinerman, Best-Selling Author

The beginnings of energy start with the tongue when it comes in contact with AlpineV.

The principal ingredient in this fabulous drink that accounts for a remarkable energy boost is the Alpine Sandthorn Berry. Because of its 38 different organic acids and a number of mineral salts, it works on rebooting muscle energy production in much the same way that a battery recharger might do for a car or truck battery that is at a low power ebb.

Cellular Battery Recharger

Inside every cell is a bacterium which serves as a sort of battery pack to help in the production of ATP (adenosine triphosphate). ATP fuels all muscle activity within the body. However, this cellular "battery pack" depends on the right kind of acid-alkaline environment in order to work properly, just as an automobile battery needs acid to remain strong.

AlpineV is the nutritional battery recharger that accomplishes this at a cellular level. Its primary ingredient, the alpine sandthorn berry, contains the helpful organic acids and mineral salts, necessary for doing this. A secondary component, pomegranate juice, contributes its own share of acids and minerals to this as well.

Some of the important organic acids and alkaline minerals in both juices include ascorbic acid, ellagic acid, omega 3-6-7-9 fatty acids, calcium, magnesium, phosphorus, potassium and copper. Unlike the acids derived from junk foods, these enhance muscle energy production rather than rob it.

Elevate Your Energy

The tartness of AlpineV is a sure sign of its high acid contents. AlpineV is a full-bodied beverage known for elevating sagging energy and ebbing stamina. Its robust flavor is exactly what cellular bacterium need to increase their output of ATP!

Rebooting your muscle strength to where it should be begins with something that grabs your immediate attention. The rich organic acids in the alpine sandthorn berry and pomegranate deliver their own special nutrition straight to the cells where molecular power packs gladly receive them. In turn, the cells' bacterium pour out more of the substance which fuels muscle activity.

When AlpineV was created, its formulators wanted something different than the cheap sugary fruit juices (apple, grape, pear) which their competitors routinely use as fillers in

their own exotic fruit blends. Realizing the importance of organic acids and mineral salts they looked far and wide for something that would deliver true energy and sustain stamina.

Tartness is Good

It came in the form of the alpine sandthorn berry, one of nature's most complete nutrition sources. The fruit's extreme tartness was one of its most appealing aspects. When blended with guanabana, watermelon, and pomegranate, it has become much more acceptable and desirable to general public tastes.

"Wake Up" Call

Anyone sampling the drink for the very first time is in for a quick "wake up" call in terms of its robust taste. Once the ingredients have had adequate time to settle within the cells of the body, a pickup in muscle energy becomes evident very soon. This is what makes AlpineV so different from everything else out there - something REAL for a change - that pays off in big energy dividends instead of short-changing you with what little bit currently remains.

The energy begins in the unique flavor and only ends when its full potential is realized in greater fuel output for nutrition-hungry muscles.

Its tart flavor is the beginning of energy

AlpineV is a 100% natural dietary supplement with no added preservatives and its potency listed on the label
